

Dear colleagues and friends!

It will be very pleasant and useful to meet at the 3rd Eurasian Congress "Waste of Electronic and Electrical Equipment Solutions ". It may be noted that the Congress will meet shortly before World Earth Day, April 22, 2018, and recall the words of Franz Mayer "We did not inherit Earth from our parents, but borrowed It from our children".

In Russia, there is a well-established practice of collecting and processing metal scrap, which for example for steelmakers is an essential component of the charged materials, a resource for steelmaking. But the recycling of waste from electronic and electrical equipment is still at the initial level of development and it is absolutely obvious that due to environmental and economic reasons it is necessary to achieve the transfer of such waste into secondary raw materials through their deep processing without harming the nature. From this point of view our debt to children is only growing.

What is required to solve this problem? In my opinion, there are three components – equipment, technology and people. There is no doubt that people, their qualification and motivation, as designers of equipment with technologies and as owners/operators of waste processing plants play the leading role.

The upcoming Congress provides an excellent opportunity to establish personal contacts with colleagues, to get acquainted with the latest trends in the recycling of electronic and electrical waste, which should be used fruitfully.

See you at the Congress!

Dmitry Elanskiy

Associate Prof., Dr of Engineering
